NASA Flood Monitoring and Mapping Tools

Outline

- Overview of Flood Monitoring Tools Based on Remote Sensing Observations
  - Global Flood Monitoring System (GFMS)
  - Extreme Rainfall Detection System-2 (ERDS2)
  - MODIS Near Real Time (NRT) Flood Mapping
  - Dartmouth Flood Observatory (DFO)

- Demonstration of GFMS, ERDS2, MODIS NRT and DFO

Overview of Flood Monitoring Tools Based on Remote Sensing Observations

NASA Remote Sensing Observations for Flood Monitoring

https://arset.gsfc.nasa.gov/disasters/webinars/advfloodwebinar

There are primarily **3 types** of flood monitoring tools that use remote sensing observations:

1. Derive streamflow & runoff to monitor flooding conditions by using rainfall and weather data in a hydrology model
2. Infer flooding conditions by using satellite-derived precipitation
3. Detect flood water on previously dry land surfaces by using satellite-derived land-cover observations

Flood Monitoring Using NASA Rainfall Observations

1. Derive streamflow & runoff to monitor flooding conditions by using rainfall and weather data in a hydrology model
   - Global Flood Monitoring System (GFMS) http://flood.umd.edu
   - NASA and U.S. Agency for International Development SERVIR: http://www.servirglobal.net

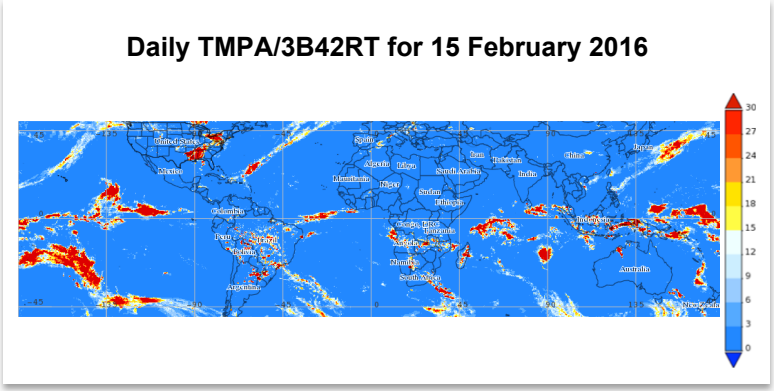
2. Infer flooding conditions by using satellite-derived precipitation
   - Extreme Rainfall Detection System (ERDS): http://erds.ithacaweb.org/

3. Detect flood water on previously dry land surfaces by using satellite-derived land-cover observations

NASA Rainfall Observations Used in GFMS, SERVIR, & ERDS2

TRMM Multi-satellite Precipitation Analysis (TMPA)

- Combines precipitation from TRMM and several national/international satellites to obtain 3-hourly, 0.25°x0.25° resolution data with **global coverage between 50°S to 50°N**
- TMPA will be replaced with Integrated Multi-SatellitE Retrievals (IMERG) for Global Precipitation Measurement (GPM)



data with half-hourly, 0.1°x0.1° resolution and **global coverage between 65°S to 65°N**

Note: TRMM is no longer flying, but TRMM-based calibration is used to provide near real-time rainfall from a constellation of national & international satellites for flooding applications. Near real-time IMERG data is also available from: ftp://jsimpson.pps.eosdis.nasa.gov

SERVIR GLOBAL

http://servirglobal.net

- Works in 30 countries
- Remote Sensing-based data products and training available via websites
- Flood monitoring and mapping based on TMPA rainfall and CREST hydrological model

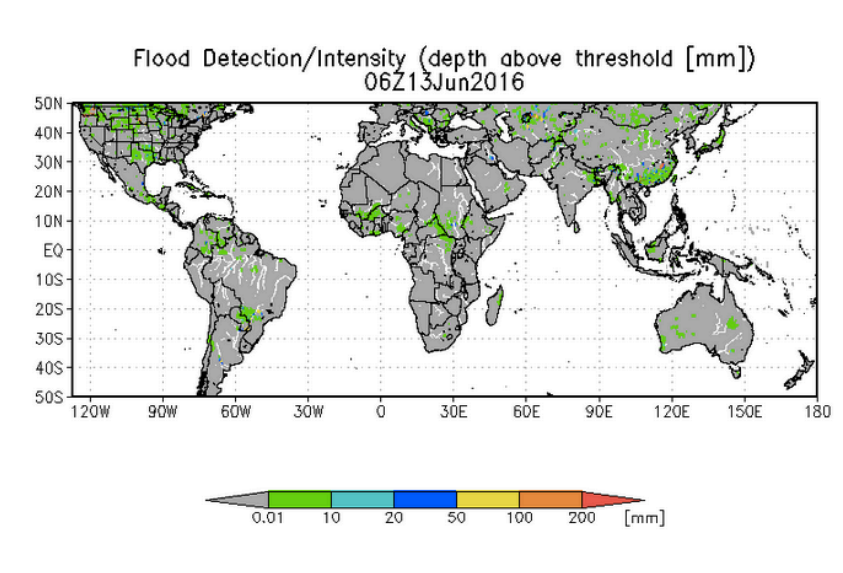
Global Flood Monitoring System (GFMS)

GFMS

http://flood.umd.edu

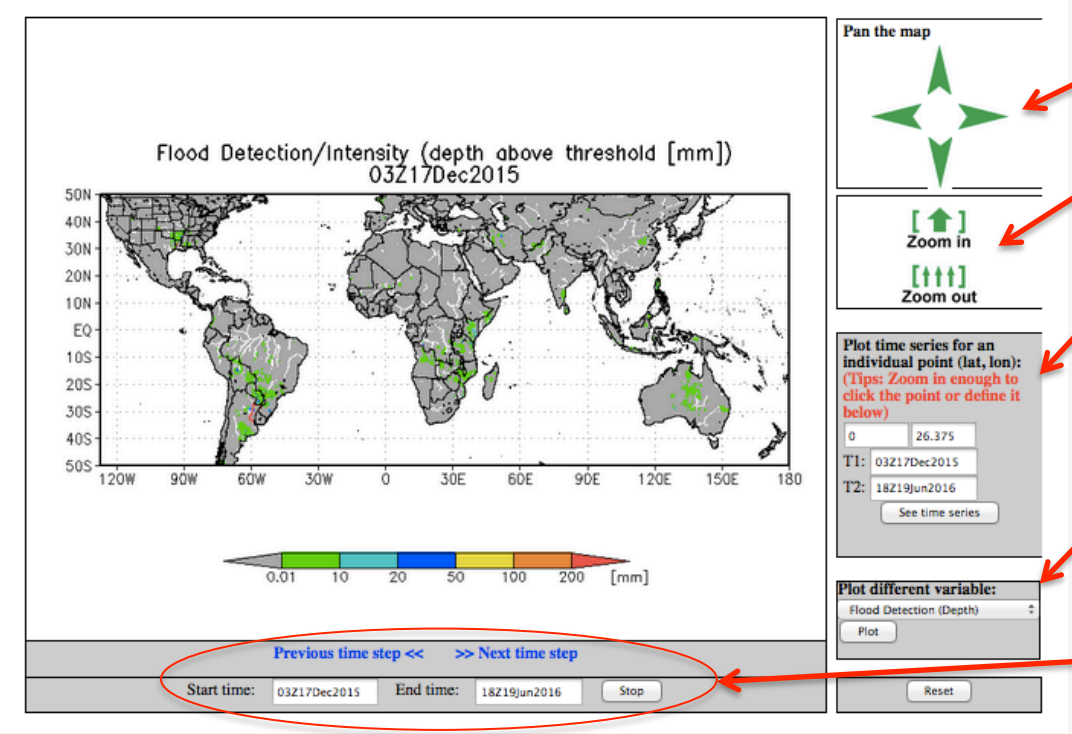
Provides global maps, time series, and animations (50°S-50°N) of:

- Instantaneous Rain
- Accumulated rain over 24, 72, and 168 hours
- Streamflow rates and flood detection at 1/8th degree (~12 km) and also at 1 km



GFMS Features

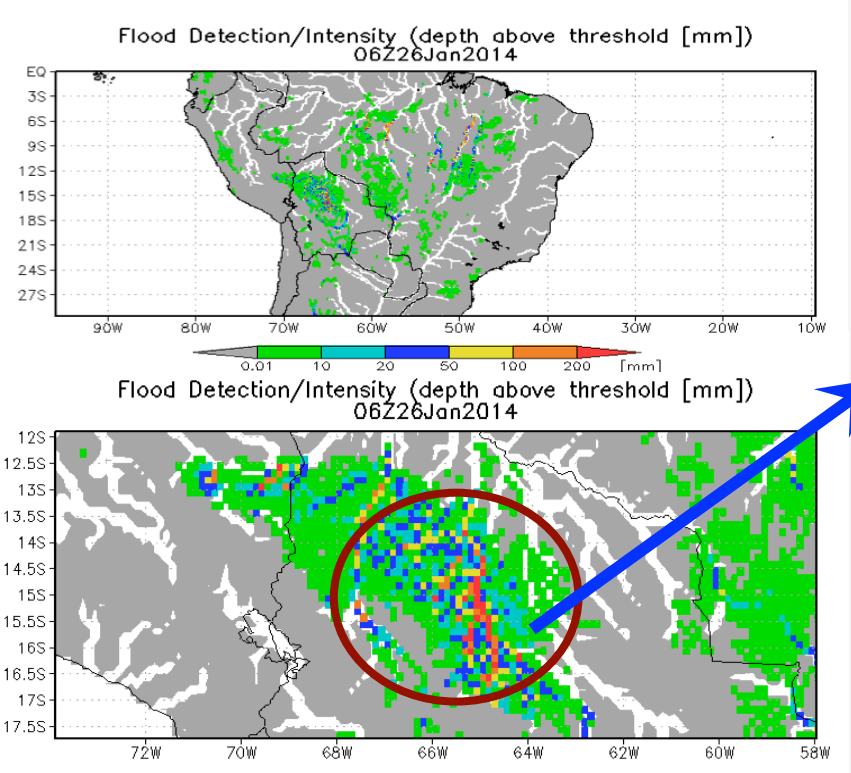
http://flood.umd.edu

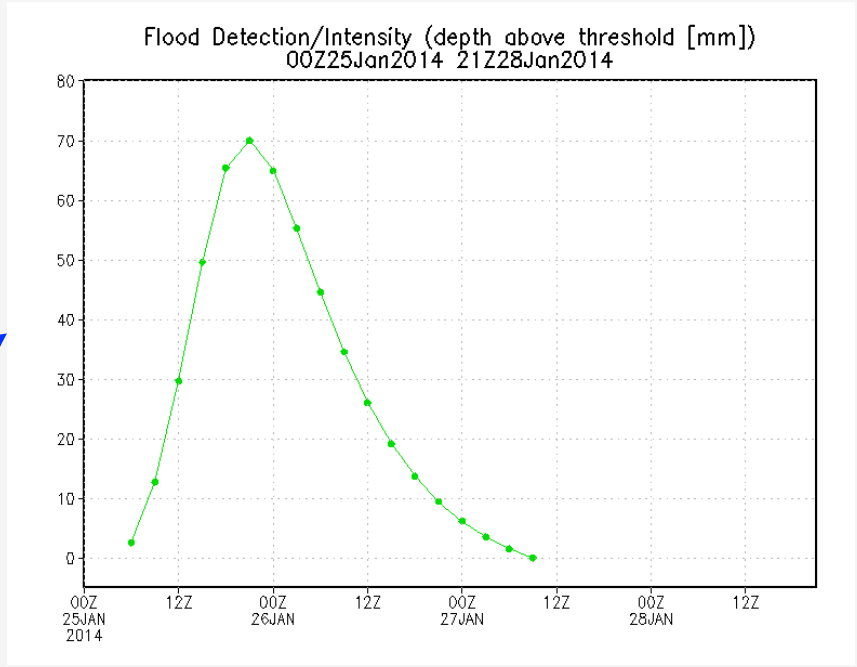


- Map navigation
- Zoom in/out
- Select individual grid point for data for time sequence
- Plot different variables
- 3-hourly output

Flooding in Bolivia – January 26, 2014

http://flood.umd.edu



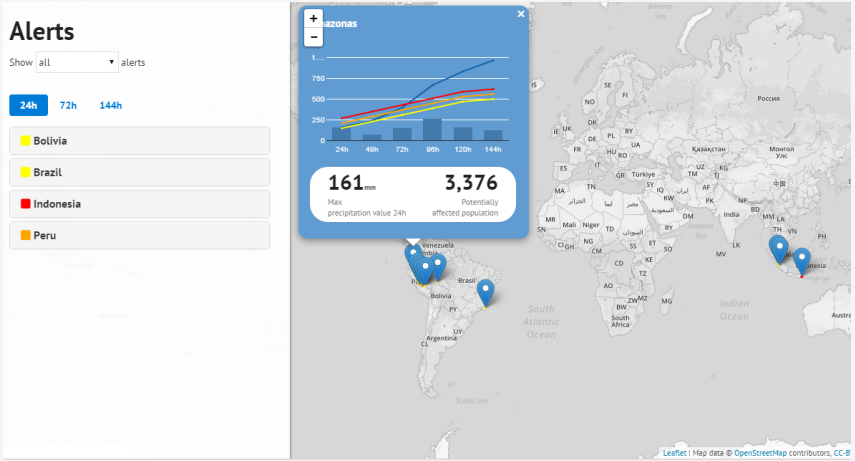


Extreme Rainfall Detection System (ERDS)

ERDS

http://erds.ithacaweb.org/

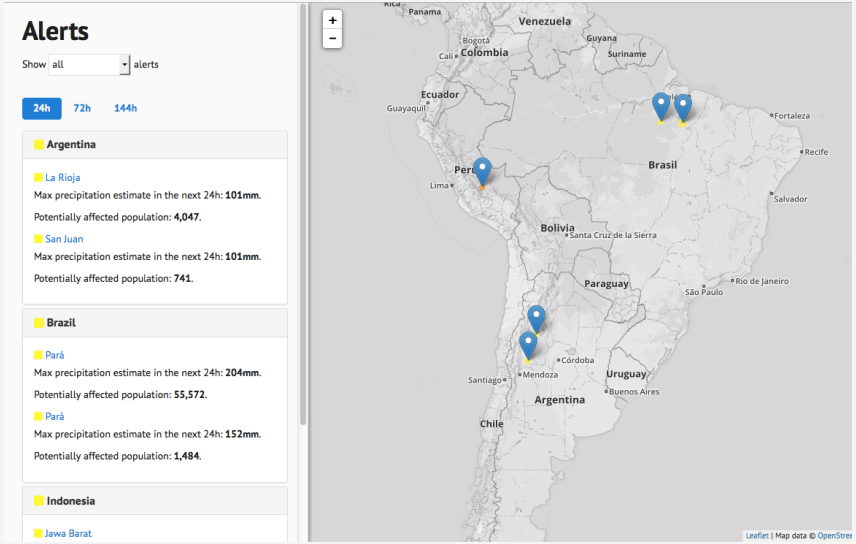
- Near real-time TRMM and NOAA-Global Forecasting System (GFS) data for monitoring & forecasting accumulated rainfall
- TRMM historical archive is used for calculation of extreme rainfall thresholds
- TRMM near real-time rainfall amount, GFS forecasted rainfall information, & reference data combine to generate flooding event-specific information



ERDS

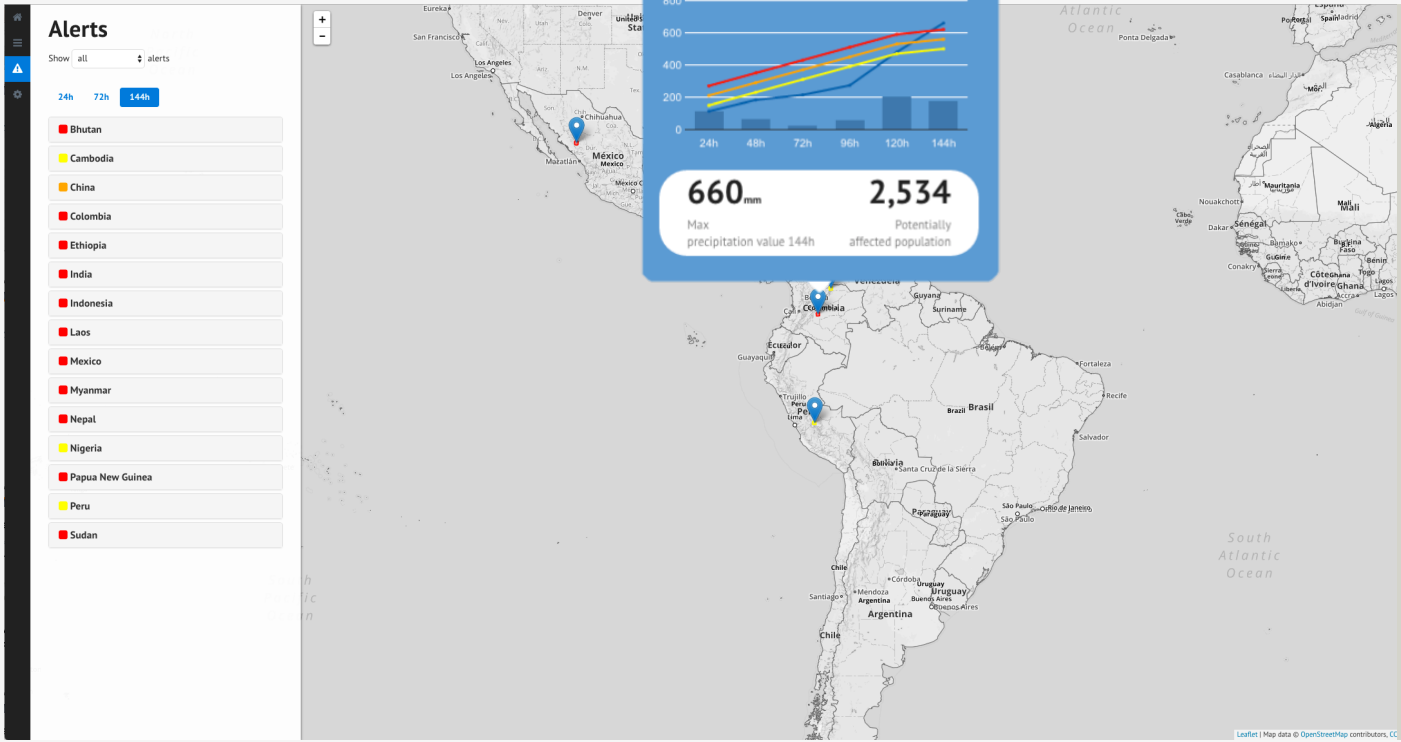
http://erds.ithacaweb.org/

- Global maps and time series of near real-time (50°S-50°N) and forecasted accumulated rainfall over 24, 48, 72, 96, 120 & 144 hours
- Extreme rainfall alerts at 0.25°x0.25° level and at administrative districts level
- Event-specific information, including:
  - the list of the affected countries
  - an estimation of the affected population
- Currently the ERDS system is one of the tools used by OMEP, UN World Food Programme (WFP) Emergency Preparedness Unit



ERDS Alerts

http://erds.ithacaweb.org



72-hour alert in Meta River, Colombia, provided on 27th June 2016

Maximum Rain forecast and potentially affected population

NASA Remote Sensing Observations for Flood Monitoring

https://arset.gsfc.nasa.gov/disasters/webinars/advfloodwebinar

There are primarily **3 types** of flood monitoring tools that use remote sensing observations:

1. Derive streamflow & runoff to monitor flooding conditions by using rainfall and weather data in a hydrology model
2. Infer flooding conditions by using satellite-derived precipitation
3. Detect flood water on previously dry land surfaces by using satellite-derived land-cover observations

Inundation Mapping

Using Satellite-Derived Land-Cover Observations

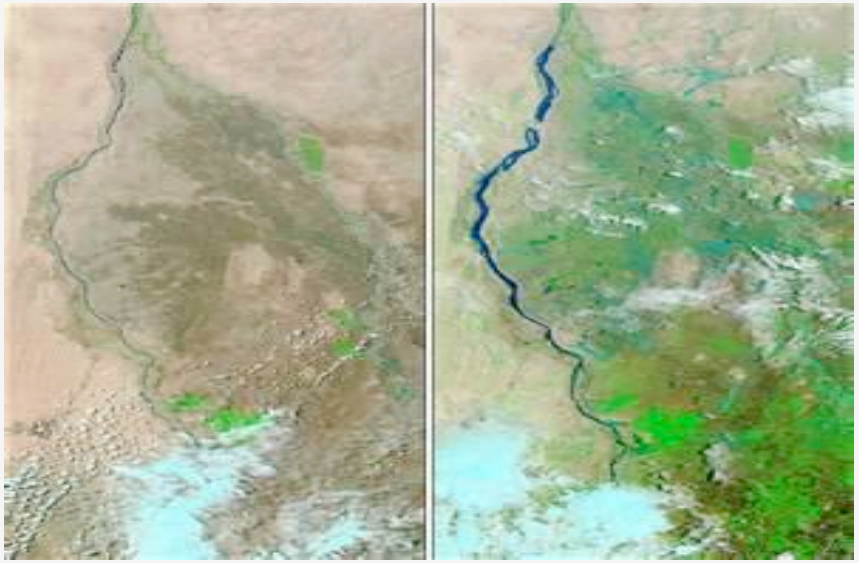
3. Detect flood water on previously dry land surfaces by using satellite-derived land-cover observations
   - MODIS NRT Global Flood Mapping: http://oas.gsfc.nasa.gov/floodmap
   - Dartmouth Flood Observatory: http://floodobservatory.colorado.edu

Inundation Mapping

Using Terra/Aqua MODerate Resolution Imaging Spectroradiometer (MODIS)

- MODIS provides observations of land surface
- Reflectance from bands indicate presence of water on previously dry land
  - 1 (620-670nm)
  - 2 (841-876 nm)
  - 7 (2105-2155nm)
- Global reference database of water bodies formed at 250m resolution
- MODIS cannot see the surface through clouds

Flooding along the White Nile, Sudan
earthobservatory.nasa.gov



MODIS-Aqua
6/19/2003

MODIS- Terra
8/11/2003

MODIS Near Real-Time Global Flood Mapping

MODIS NRT Global Flood Mapping

- Flood mapping based on MODIS reflectance at 250m resolution
- Composited on 2, 3, and 14 days
- Flood maps available in 10°x10° tile
- Permanent water and surface flood water data available
- Cloud shadows or terrain shadows can be misinterpreted as surface water

Provides near real-time and past flood mapping from April 2011.
http://oas.gsfc.nasa.gov/floodmap

MODIS NRT Global Flood Mapping: Available Quantities

http://oas.gsfc.nasa.gov/floodmap

Products		Available Downloads	
MODIS Flood Map	MFM	png	
MODIS Flood Water	MFW	shapefile (.zip)	KMZ
MODIS Surface Water	MSW	shapefile (.zip)	KMZ
MODIS Water Product	MWP	geotiff

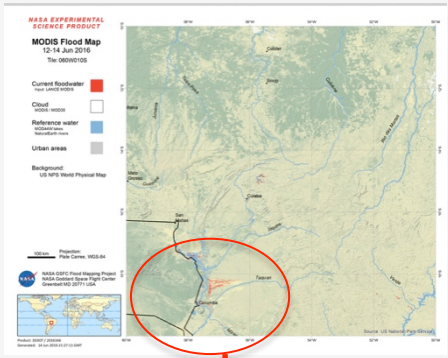
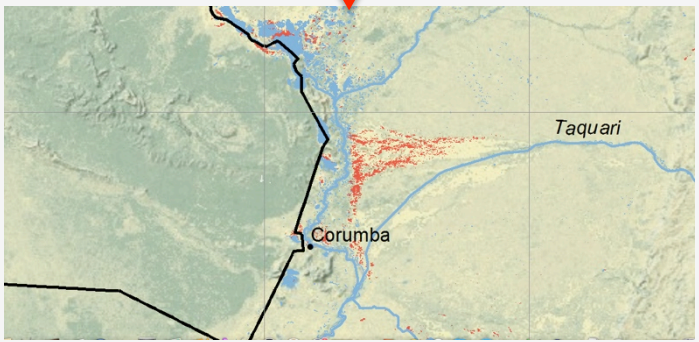
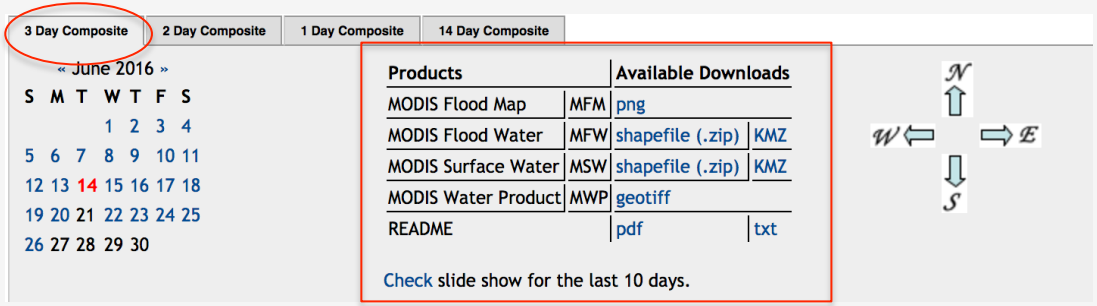
10-day Slides

MODIS Flood Mapping: Flooding in Southern Brazil 12-14, 2016

3-day Composite







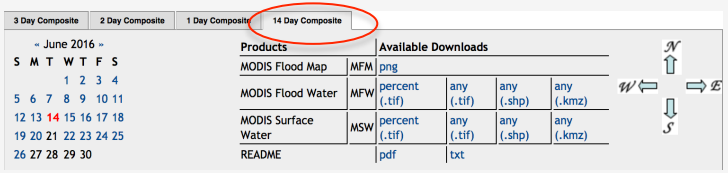
Filename Convention:

PRODUCT_DATE_TILE_COMPOSITE_XTRA.EXT

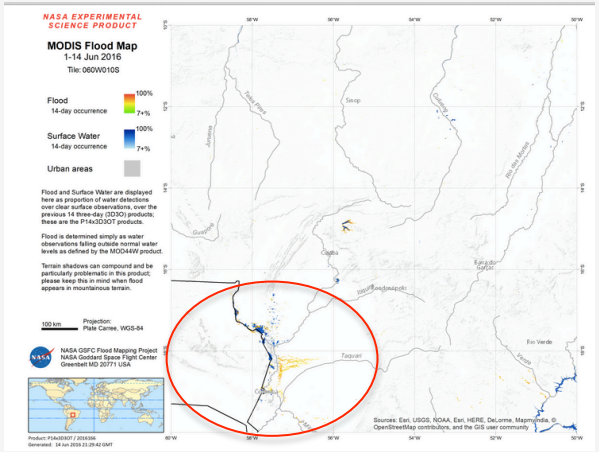
MSW_2012009_020E000S_3D3**O**_V.shp
MFM_2012009_020E000S_2D2**O**.png

(yyyydoy lon-lat 2 or 3 day **O**bservations
(Year and day of year)

MODIS Flood Mapping: Flooding in Southern Brazil 12-14, 2016



Composites of the previous 14 days' 3-day product



Similar filename convention with additional processing for composite field:

N: No shadow masking

T: Terrain shadow masking

C: Cloud shadow masking

S: Both terrain & shadow masking

e.g. 2D2OT:
2 days imagery, 2 observations required, terrain shadow masking applied

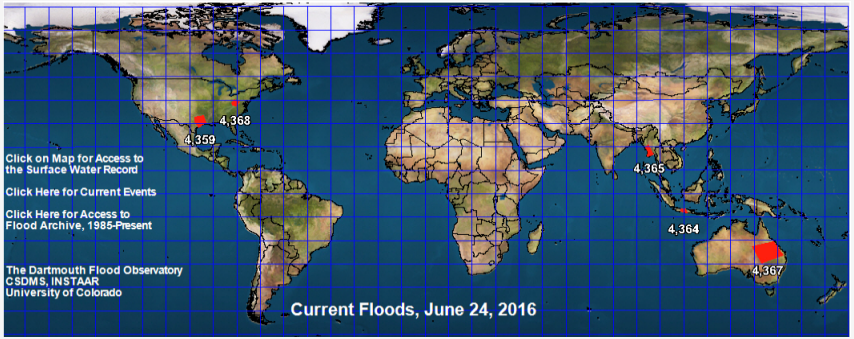
- Provides occurrence of water as % clear observations over the last 14 days' products
  - GeoTIFF are 0-1 images (1 if % water is >0)

The Dartmouth Flood Observatory (DFO)

DFO

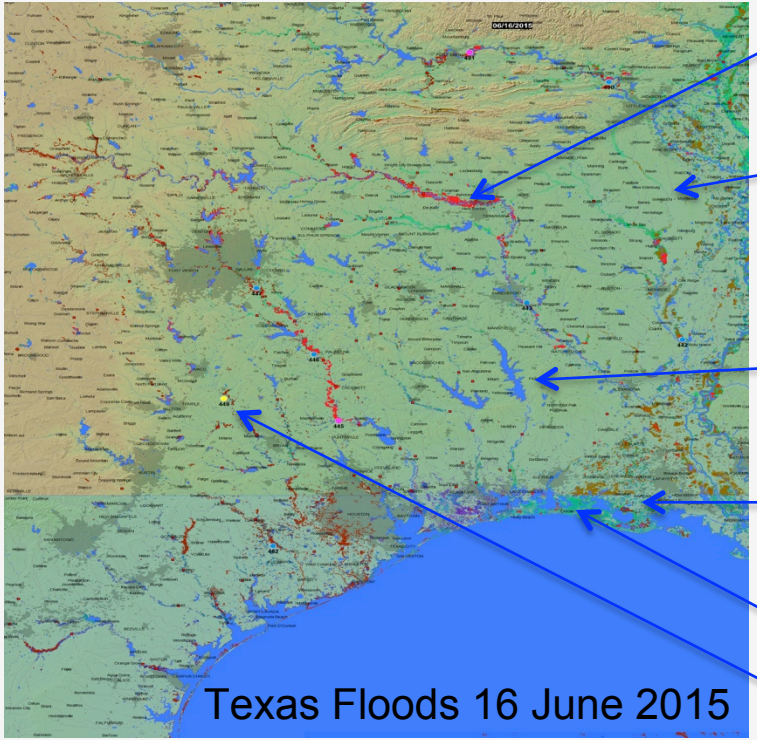
http://floodobservatory.colorado.edu

- Uses flood mapping based on MODIS reflectance
- Also uses Landsat-8 and EO-1 images and COSMO-SkyMed and Sentinel-1 synthetic aperture radar (SAR) images when available
- Experimental river discharge obtained by using Microwave data (AMSR, AMSR-2, TMI, GMI0 and a run-off model



Provides near-real time flood mapping and current/past flood event mapping

DFO Flood Event Mapping



Red: Flooding within past 14 days (MODIS animated product)

Light Red: Flooding during this event (earlier MODIS coverage of non-automated MODIS mapping)

Dark Blue: Permanent water, Feb 2000 (Shuttle Water Boundary Data)

Darker Red: Flooded areas (High resolution SAR or Landsat 8 data)

Bright Green: Past Floods

Colored dots show *access River Watch Site*

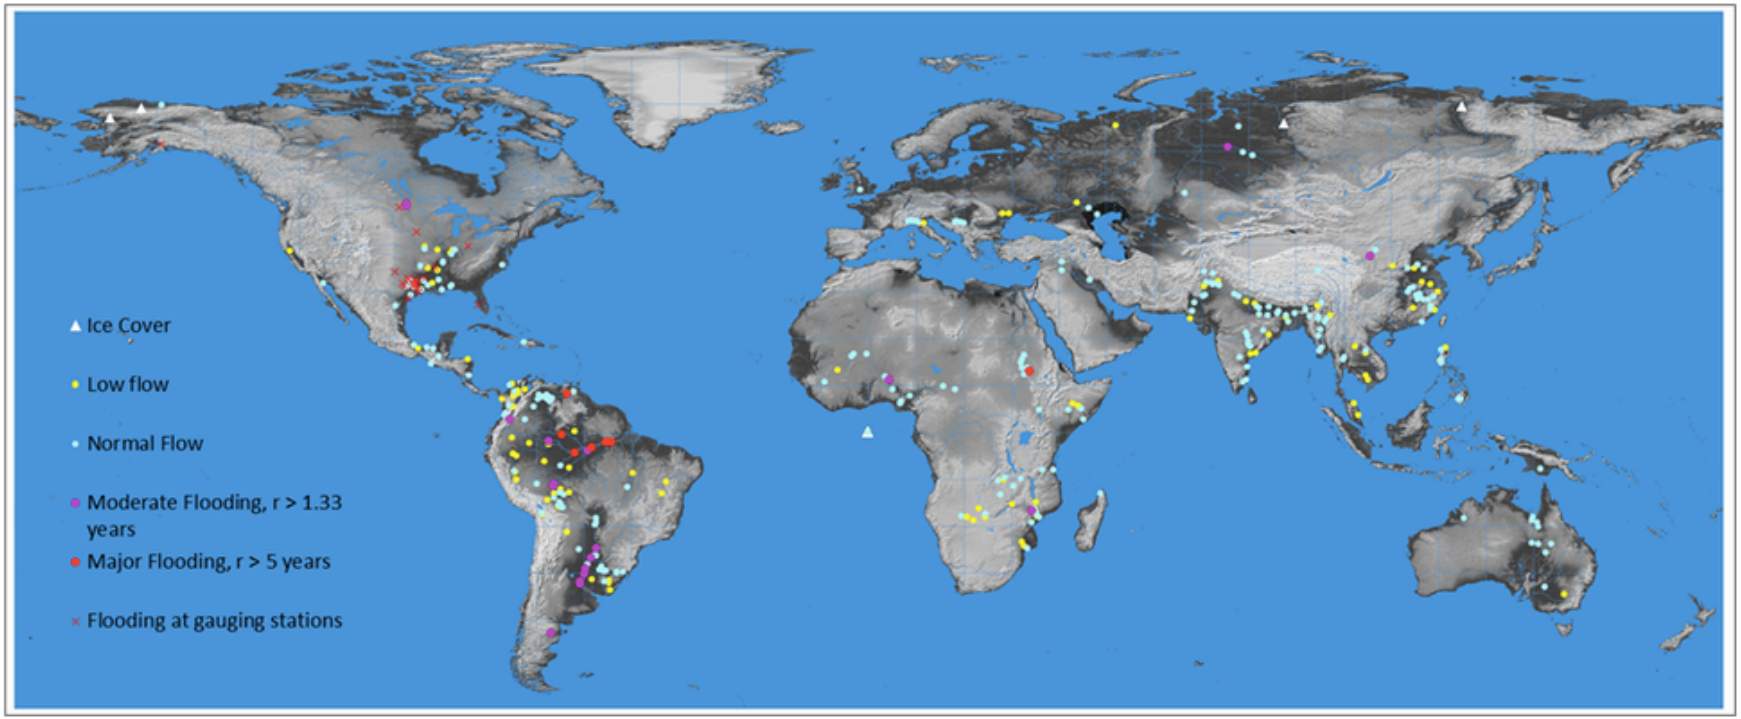
DFO Experimental River Watch

http://floodobservatory.colorado.edu

- Sensitive to portions of water and dry land:
  - Advanced Microwave Scanning Radiometer-2 from GCOM-W (Japanese Space Agency Mission)
  - TRMM Microwave Imager (ended 8 April 2015)
  - GPM Microwave Imager
- **These microwave observations are converted to actual river discharge** by combining them with surface discharge measurements and then to runoff by using a Water Balance Model (WBM)
- Runoff calculations are available starting in 2003, seven-day runoff deviation started in 2003-2007
- Mean runoff is mapped to indicate low, normal, moderate, and major flooding

DFO River Watch Locations

http://floodobservatory.colorado.edu



DFO River Watch Paraguay
